Art Unit: 1614 Phone Number 571-272-0573 Serial Number: 10/659,708

Mail Box and Bldg/Room Location: 3C70/3461 Results Format Preferred (circle): PAPER DISK E-MAIL

If more than one search is submitted, please prioritize searches in order of need.

****

Please provide a detailed statement of the search topic, and describe as specifically as possible the subject matter to be searched. Include the elected species or structures, keywords, synonyms, acronyms, and registry numbers, and combine with the concept or utility of the invention. Define any terms that may have a special meaning. Give examples or relevant citations, authors, etc, if known. Please attach a copy of the cover sheet, pertinent claims, and abstract.

Title of Invention: Methods for treating lung cancer using insulin-like growth factor.

Inventors (please provide full names): _____

Earliest Priority Filing Date: 9/11/02

For Sequence Searches Only Please include all pertinent information (parent, child, divisional, or issued patent numbers) along with the appropriate serial number.

please search the claimed method of use.

AB The present invention relates to protein complexes involved in cellular processes which have been shown to be critical for the development of various forms of cancer, component proteins of the said complexes, fragments and derivs. of the component proteins, and antibodies specific to the complexes. The present invention also relates to methods for use of the complexes and their interacting proteins in, inter alia, screening, diagnosis, and therapy, as well as to methods of preparing the complexes.

(colorectal; human protein sequences of protein complexes of cellular networks underlying the development of cancer and other diseases)

IT Proteins
RL: DGN (Diagnostic use); PRP (Properties); BIOL (Biological study); USES (Uses)
(complexes; human protein sequences of protein complexes of cellular networks underlying the development of cancer and other diseases)

IT Antibodies and Immunoglobulins
RL: DGN (Diagnostic use); THU (Therapeutic use); BIOL (Biological study); USES (Uses)
(complexes; human protein sequences of protein complexes of cellular networks underlying the development of cancer and other diseases)

IT Nervous system, disease
(degeneration; human protein sequences of protein complexes of cellular networks underlying the development of cancer and other diseases)

IT Interleukins
RL: DGN (Diagnostic use); PRP (Properties); THU (Therapeutic use); BIOL (Biological study); USES (Uses)
(enhancer binding factor 3; human protein sequences of protein complexes of cellular networks underlying the development of cancer and other diseases)

IT Growth factor receptors
RL: DGN (Diagnostic use); PRP (Properties); THU (Therapeutic use); BIOL (Biological study); USES (Uses)
(erbB-3, HER$; human protein sequences of protein complexes of cellular networks underlying the development of cancer and other diseases)

IT Antibodies and Immunoglobulins
RL: DGN (Diagnostic use); THU (Therapeutic use); BIOL (Biological study); USES (Uses)
(fragments; human protein sequences of protein complexes of cellular networks underlying the development of cancer and other diseases)

IT Agglutinins and Lectins
RL: DGN (Diagnostic use); PRP (Properties); THU (Therapeutic use); BIOL (Biological study); USES (Uses)
(galectin-7; human protein sequences of protein complexes of cellular networks underlying the development of cancer and other diseases)

IT Proteins

RL: DGN (Diagnostic use); PRP (Properties); THU (Therapeutic use); BIOL (Biological study); USES (Uses)
(gene CDC2, complexes; human protein sequences of protein complexes of cellular networks underlying the development of cancer and other diseases)

IT Phosphoproteins
RL: DGN (Diagnostic use); PRP (Properties); THU (Therapeutic use); BIOL (Biological study); USES (Uses)
(gene cdk2, complexes; human protein sequences of protein complexes of cellular networks underlying the development of cancer and other diseases)

IT Ribonucleoproteins
RL: DGN (Diagnostic use); PRP (Properties); THU (Therapeutic use); BIOL (Biological study); USES (Uses)
(hnRNP (heterogeneous nuclear ribonucleoprotein); human protein sequences of protein complexes of cellular networks underlying the development of cancer and other diseases)

IT Ribonucleoproteins
RL: DGN (Diagnostic use); PRP (Properties); THU (Therapeutic use); BIOL (Biological study); USES (Uses)
(hnRNP H2 (heterogeneous nuclear ribonucleoprotein H2); human protein sequences of protein complexes of cellular networks underlying the development of cancer and other diseases)

IT Alzheimer's disease
Bladder, neoplasm
Buffers
Chemotherapy
Disease, animal
Drug design
Drug screening
Drugs
Genetic vectors
Human
Labels
Leukemia
Lung, neoplasm
Lymphoma
Mammary gland, neoplasm
Melanoma
Microarray technology
Molecular cloning
Multiple myeloma
Neoplasm
Nucleic acid hybridization
Ovary, neoplasm
Prognosis
Prostate gland, neoplasm
Protein sequences
Psoriasis
Stomach, neoplasm
Susceptibility (genetic)
Test kits
Transcriptional regulation
Transformation, genetic
(human protein sequences of protein complexes of cellular networks underlying the development of cancer and other diseases)

IT Reagents
RL: ARG (Analytical reagent use); DGN (Diagnostic use); THU (Therapeutic use); ANST (Analytical study); BIOL (Biological study); USES (Uses)
(human protein sequences of protein complexes of cellular networks underlying the development of cancer and other diseases)

IT Nucleic acids
RL: DGN (Diagnostic use); PRP (Properties); BIOL (Biological study); USES

(Uses)
(human protein sequences of protein complexes of cellular networks underlying the development of cancer and other diseases)

IT Actins
Epidermal growth factor receptors
Filamin
GTPase-activating protein
Glial fibrillary acidic protein
Hepatocyte growth factor receptors
Proliferating cell nuclear antigen
Transcription factors
Transferrin receptors
neu (receptor)
neu (receptor)
α1-Acid glycoprotein
RL: DGN (Diagnostic use); PRP (Properties); THU (Therapeutic use); BIOL (Biological study); USES (Uses)
(human protein sequences of protein complexes of cellular networks underlying the development of cancer and other diseases)

IT Antibodies and Immunoglobulins
RL: DGN (Diagnostic use); THU (Therapeutic use); BIOL (Biological study); USES (Uses)
(human protein sequences of protein complexes of cellular networks underlying the development of cancer and other diseases)

IT Apoptosis
(induction, by Bcl-2; human protein sequences of protein complexes of cellular networks underlying the development of cancer and other diseases)

IT Neoplasm
(metastasis, by Gab1 protein complex; human protein sequences of protein complexes of cellular networks underlying the development of cancer and other diseases)

IT Diagnosis
(mol.; human protein sequences of protein complexes of cellular networks underlying the development of cancer and other diseases)

IT Proteins
RL: DGN (Diagnostic use); PRP (Properties); THU (Therapeutic use); BIOL (Biological study); USES (Uses)
(mutS; human protein sequences of protein complexes of cellular networks underlying the development of cancer and other diseases)

IT Proteins
RL: DGN (Diagnostic use); PRP (Properties); THU (Therapeutic use); BIOL (Biological study); USES (Uses)
(nuclear matrix-associated; human protein sequences of protein complexes of cellular networks underlying the development of cancer and other diseases)

IT Proteins
RL: DGN (Diagnostic use); PRP (Properties); THU (Therapeutic use); BIOL (Biological study); USES (Uses)
(nucleolar organizer-associated; human protein sequences of protein complexes of cellular networks underlying the development of cancer and other diseases)

IT Proteins
RL: DGN (Diagnostic use); PRP (Properties); THU (Therapeutic use); BIOL (Biological study); USES (Uses)
(nucleophosmin; human protein sequences of protein complexes of cellular networks underlying the development of cancer and other diseases)

IT Proteins
RL: DGN (Diagnostic use); PRP (Properties); THU (Therapeutic use); BIOL (Biological study); USES (Uses)
(nucleoplasmins; human protein sequences of protein complexes of cellular networks underlying the development of cancer and other

diseases)
IT Proteins
RL: DGN (Diagnostic use); PRP (Properties); THU (Therapeutic use); BIOL (Biological study); USES (Uses)
(p120; human protein sequences of protein complexes of cellular networks underlying the development of cancer and other diseases)
IT Proteins
RL: DGN (Diagnostic use); PRP (Properties); THU (Therapeutic use); BIOL (Biological study); USES (Uses)
(p23; human protein sequences of protein complexes of cellular networks underlying the development of cancer and other diseases)
IT Ras proteins
RL: DGN (Diagnostic use); PRP (Properties); THU (Therapeutic use); BIOL (Biological study); USES (Uses)
(p23R-ras; human protein sequences of protein complexes of cellular networks underlying the development of cancer and other diseases)
IT Proteins
RL: DGN (Diagnostic use); PRP (Properties); THU (Therapeutic use); BIOL (Biological study); USES (Uses)
(p30; human protein sequences of protein complexes of cellular networks underlying the development of cancer and other diseases)
IT Animal tissue
Cell
Organ, animal
(protein expression in; human protein sequences of protein complexes of cellular networks underlying the development of cancer and other diseases)
IT Proteins
RL: DGN (Diagnostic use); THU (Therapeutic use); BIOL (Biological study); USES (Uses)
(recombinant, protein fused with tag or label; human protein sequences of protein complexes of cellular networks underlying the development of cancer and other diseases)
IT Proteins
RL: DGN (Diagnostic use); PRP (Properties); THU (Therapeutic use); BIOL (Biological study); USES (Uses)
(semaphorin 3A; human protein sequences of protein complexes of cellular networks underlying the development of cancer and other diseases)
IT Neoplasm
(solid; human protein sequences of protein complexes of cellular networks underlying the development of cancer and other diseases)
IT Proteins
RL: DGN (Diagnostic use); PRP (Properties); THU (Therapeutic use); BIOL (Biological study); USES (Uses)
(telokins; human protein sequences of protein complexes of cellular networks underlying the development of cancer and other diseases)
IT Transport proteins
RL: DGN (Diagnostic use); PRP (Properties); THU (Therapeutic use); BIOL (Biological study); USES (Uses)
(tricarboxylate transporter; human protein sequences of protein complexes of cellular networks underlying the development of cancer and other diseases)
IT Amyloid
RL: DGN (Diagnostic use); PRP (Properties); THU (Therapeutic use); BIOL (Biological study); USES (Uses)
(β-; human protein sequences of protein complexes of cellular networks underlying the development of cancer and other diseases)

AB The present invention provides methods of inhibiting cancer cell growth by using insulin-like growth factor-**binding protein IGFBP-3** polypeptides and expression constructs coding therefor. In a particular aspect, the invention provides adenoviral constructs expressing **IGFBP-3**, and their use to inhibit non-small cell lung cancer. In addition, **IGFBP-3** expression can be diagnostic of cancer development and progression. Methods for assessing **IGFBP-3** expression, for example using promoter methylation assays, are described.

ST viral vector **IGFBP3** diagnosis antitumor lung cancer

IT Genetic methods
(DNAse protection, for detecting **IGFBP-3** gene mutation; viral vectors encoding **IGFBP-3** and use for the diagnosis and treatment of cancer)

IT Gene, microbial
RL: BSU (Biological study, unclassified); BIOL (Biological study)
(E1, deletion of; viral vectors encoding **IGFBP-3** and use for the diagnosis and treatment of cancer)

IT **Insulin-like growth factor-binding proteins**
RL: BPN (Biosynthetic preparation); BUU (Biological use, unclassified); DGN (Diagnostic use); THU (Therapeutic use); BIOL (Biological study); PREP (Preparation); USES (Uses)
(**IGFBP-3**; viral vectors encoding **IGFBP-3** and use for the diagnosis and treatment of cancer)

IT Estrogen receptors
RL: BUU (Biological use, unclassified); THU (Therapeutic use); BIOL (Biological study); USES (Uses)
(binding agent, for cancer therapy; viral vectors encoding **IGFBP-3** and use for the diagnosis and treatment of cancer)

IT Promoter (genetic element)
RL: BUU (Biological use, unclassified); BIOL (Biological study); USES (Uses)
(cancer tissue-specific, inducible, constitutive; viral vectors encoding **IGFBP-3** and use for the diagnosis and treatment of cancer)

IT Intestine, neoplasm
(colon; viral vectors encoding **IGFBP-3** and use for the diagnosis and treatment of cancer)
IT Adenoviral vectors
Genetic vectors
Retroviral vectors
(encoding **IGFBP-3**; viral vectors encoding **IGFBP-3** and use for the diagnosis and treatment of cancer)
IT DNA sequence analysis
RFLP (restriction fragment length polymorphism)
(for detecting **IGFBP-3** gene mutation; viral vectors encoding **IGFBP-3** and use for the diagnosis and treatment of cancer)
IT Neoplasm
(hematol.; viral vectors encoding **IGFBP-3** and use for the diagnosis and treatment of cancer)
IT Promoter (genetic element)
RL: BUU (Biological use, unclassified); BIOL (Biological study); USES (Uses)
(immediate early, CMV; viral vectors encoding **IGFBP-3** and use for the diagnosis and treatment of cancer)
IT Drug delivery systems
(intratumoral, systemic; viral vectors encoding **IGFBP-3** and use for the diagnosis and treatment of cancer)
IT Microwave
UV radiation
(irradiation, therapy; viral vectors encoding **IGFBP-3** and use for the diagnosis and treatment of cancer)
IT Gamma ray
(irradiation; viral vectors encoding **IGFBP-3** and use for the diagnosis and treatment of cancer)
IT PCR (polymerase chain reaction)
(methylation specific; viral vectors encoding **IGFBP-3** and use for the diagnosis and treatment of cancer)
IT Neck, anatomical
(neoplasm; viral vectors encoding **IGFBP-3** and use for the diagnosis and treatment of cancer)
IT **Lung, neoplasm**
(**non-small-cell carcinoma**, treatment of; viral vectors encoding **IGFBP-3** and use for the diagnosis and treatment of cancer)
IT Lipids, biological studies
RL: BUU (Biological use, unclassified); BIOL (Biological study); USES (Uses)
(non-viral vector encapsulated with; viral vectors encoding **IGFBP-3** and use for the diagnosis and treatment of cancer)
IT Mutation
(of **IGFBP-3** gene; viral vectors encoding **IGFBP-3** and use for the diagnosis and treatment of cancer)
IT Methylation
(of the **IGFBP-3** promoter; viral vectors encoding **IGFBP-3** and use for the diagnosis and treatment of cancer)
IT Gene, animal
RL: BSU (Biological study, unclassified); BIOL (Biological study)
(oncogene, antisense, therapy; viral vectors encoding **IGFBP-3** and use for the diagnosis and treatment of cancer)
IT Hormones, animal, biological studies
RL: BSU (Biological study, unclassified); BIOL (Biological study)
(peptide, therapy; viral vectors encoding **IGFBP-3**

and use for the diagnosis and treatment of cancer)
IT Genetic element
RL: BSU (Biological study, unclassified); BIOL (Biological study)
(polyadenylation signal, **IGFBP-3** encoding vector comprising; viral vectors encoding **IGFBP-3** and use for the diagnosis and treatment of cancer)
IT Proteins
RL: BSU (Biological study, unclassified); BIOL (Biological study)
(pro-apoptotic, therapy; viral vectors encoding **IGFBP-3** and use for the diagnosis and treatment of cancer)
IT Cytomegalovirus
(promoter; viral vectors encoding **IGFBP-3** and use for the diagnosis and treatment of cancer)
IT Antibodies and Immunoglobulins
RL: BSU (Biological study, unclassified); BIOL (Biological study)
(single chain, anti-oncogene, therapy; viral vectors encoding **IGFBP-3** and use for the diagnosis and treatment of cancer)
IT Antibodies and Immunoglobulins
Cytokines
Toxins
RL: BSU (Biological study, unclassified); BIOL (Biological study)
(therapy; viral vectors encoding **IGFBP-3** and use for the diagnosis and treatment of cancer)
IT Adeno-associated virus
Herpesviridae
Papillomavirus
Vaccinia virus
(vector, encoding **IGFBP-3**; viral vectors encoding **IGFBP-3** and use for the diagnosis and treatment of cancer)
IT Antitumor agents
Brain, neoplasm
Chemotherapy
Esophagus, neoplasm
Gene therapy
Head, neoplasm

AB New compns. based on **IGF-binding protein** sequences are provided. The peptides of the invention have the following biol. property pro-apoptotic, antiangiogenic, antiinflammatory, cardiovascular, metal-binding, ECM-binding, cell internalization, protease inhibition, transcriptional modulation, cell imaging, and expression tag properties. New tools for high-throughput research are provided. New methods for the treatment of human disease are provided. **IGFBP-3**-derived peptide or small mol. is administered to subjects having disease, thereby alleviating the symptoms of the disease. The diseases that can be treated include cancer, autoimmune disease, cardiovascular indications, arthritis, asthma and allergy, reproductive indications, retinal proliferative disease, bone disease, inflammatory disease, inflammatory bowel disease, and fibrotic disease.

AB A method of inhibiting proliferation of cells associated with a tumor in a subject comprises administering to the subject a tumor cell proliferation-inhibiting amount of **IGF**-BP3, thereby inhibiting proliferation of the cells. An improved surgical method comprises surgically resecting a tumor from a subject and administering to the subject an amount of a protein effective to inhibit metastasis of any tumor cells released in the subject's blood circulation during the surgical resection of the tumor.

AB A review. The insulin-like growth factor (**IGF**) family of ligands, **binding proteins** and receptors is an important growth factor system involved in both the development of the organism and the maintenance of normal function of many cells of the body. The system also has powerful anti-apoptotic effects. More recently, evidence has accrued to demonstrate that the **IGFs** play an important role in cancer. Individuals with serum **IGF**-II levels in the upper quartile of the normal range (and **IGF binding protein**-3 levels in the lower quartiles) have a relative risk for developing breast, prostate, colon and lung cancer. **IGF**-II is commonly expressed by tumor cells and may act as an autocrine growth factor; occasionally even reaching target tissues and causing tumor-induced hypoglycemia. The **IGF**-I receptor is commonly (though not always) overexpressed in many cancers, and many recent studies have identified new signaling pathways emanating from the **IGF**-I receptor that affect cancer cell proliferation, adhesion, migration and cell death; functions that are critical for cancer cell survival and metastases. In this review, many aspects of the **IGF** system and its relationship to cancer will be discussed.

AB The activities of insulin-like growth factors (**IGFs**), including mitogenic and antiapoptotic properties, are modulated by a family of high-affinity insulin-like growth factor-**binding proteins** (**IGFBPs**), of which **IGFBP-3** is the major serum carrier protein. Even though it is well known that **IGFBP-3** plays an important role in cell proliferation, the expression of **IGFBP-3** and its significance in primary nonsmall cell lung cancer (NSCLC) samples are unknown. This study explored **IGFBP-3** expression in tumor samples from 74 patients with a diagnosis of pathol. stage I NSCLC to determine if the expression status of IFGBP-3 influences the prognosis of patients with NSCLC. Two-sided statistical analyses were performed to correlate the clin. parameters and the prognostic effect with the **IGFBP-3** expression level in this cohort. Reduced **IGFBP-3** expression was found in 42 (56.8%) of 74 samples, and it was more frequent in large cell carcinoma than in squamous cell carcinoma and adenocarcinoma, although this difference was not statistically significant. This phenomenon was not associated with the other clinicopathol. parameters tested, such as age, sex, histol. grade, and smoking history. Significant statistical correlation between **IGFBP-3** expression and disease-specific survival was noted (P = 0.019 by log-rank test). Although statistically nonsignificant, patients with decreased **IGFBP-3** expression had shorter overall, disease-free, and event-free survival rates than did patients with normal **IGFBP-3** expression. In a multivariate anal. using **IGFBP-3** expression and other clinicopathol. parameters, the level of **IGFBP-3** expression remained as an independent factor for predicting a shorter disease-specific survival probability (P = 0.020). Our work demonstrates that down-regulation of **IGFBP-3** is a frequent event in stage I NSCLC and correlates with the disease-specific survival probability of patients with stage I NSCLC. These results suggest that **IGFBP-3** functions as a tumor suppressor and plays an important role in determining biol. aggressiveness in early NSCLC.

Section cross-reference(s): 3
AB Purpose: The activities of insulin-like growth factors (**IGFs**) in regulating cell proliferation, differentiation, and apoptosis are modulated by a family of high-affinity specific **IGF-binding proteins** (**IGFBPs**), especially **IGFBP-3**, the most abundant **IGFBP** in circulation. Hypermethylation of the promoter represses the expression of the **IGFBP-3** gene. The purpose of this study was to determine whether the methylation status of **IGFBP-3** promoter influences the prognosis of non-small cell lung cancer (NSCLC). Exptl. Design: Eighty-three patients with pathol. stage I NSCLC who had undergone curative surgery were investigated for promoter hypermethylation of **IGFBP-3** by methylation-specific PCR. Statistical analyses, all two-sided, were performed to determine the prognostic effect of methylation status of the **IGFBP-3** promoter on various clin. parameters. **IGFBP-3** was the only mol. parameter tested on these tissues in this study. Results: Hypermethylation of the **IGFBP-3** promoter was found in 51 (61.5%) of the 83 tumors. The clinicopathol. factors, such as age, histol. type, histol. grade, gender, and smoking status, of corresponding patients, did not exhibit statistically significant association with the methylation status of **IGFBP-3** promoter. However, patients with a hypermethylated **IGFBP-3** promoter had a significantly lower 5-yr disease-specific, disease-free, and overall survival rate than did those without a methylated **IGFBP-3** promoter (53.1% vs. 86.1%, P = 0.006; 36.5% vs. 76.2%, P = 0.007; and 38.9% vs. 64.0%, P = 0.022, resp.). Moreover, multivariate anal. indicated that hypermethylation of the **IGFBP-3** promoter was the only independent predictor for disease-free and disease-specific survival among the clin. and histol. parameters tested. Conclusions: Hypermethylation of the **IGFBP-3** promoter, as measured by methylation-specific PCR, is a frequent phenomenon and strongly associated with poor prognosis among patients with stage I NSCLC.

OS MARPAT 137:242156
AB Peptides are provided that antagonize the interaction of **IGF**-1 with its **binding proteins**, insulin receptor, and **IGF** receptor. These **IGF** antagonist peptides are useful in treating disorders involving **IGF**-1 as a causative agent, such as, for example, various cancers. The invention also provides conjugates comprising the peptide conjugated with a cytotoxic agent or polyethylene glycol. The cytotoxic agent here may be one that is active in killing

cells once internalized. Uses of these peptides include all uses that antagonize at least one biol. activity of exogenous or endogenous **IGFs**. They can be used in treating, inhibiting, or preventing conditions in which an **IGF** antagonist such as **IGFBP**-3 or antibodies to **IGF**-1 is useful. The invention also provides a composition comprising one of the peptides described above in a carrier. Preferably, this composition is sterile and the carrier is a pharmaceutically acceptable carrier. Also preferred is the composition further comprising an angiogenic agent or chemotherapeutic agent, and also one that is suitable for injection or inhalation. A kit is also provided comprising a container containing the composition and instructions directing the

user to utilize the composition In a further preferred embodiment, before the administration step of the above method, the concentration of **IGF**-1 in a body sample from the mammal is measured, wherein an elevated concentration of **IGF**-1 above a reference range for **IGF**-1 indicates an increased risk for the disorder. The body sample is preferably selected from the group consisting of tumor tissue, blood, plasma, serum, mammary fluid, and seminal fluid. In another preferred embodiment, the **IGF**-1 is total **IGF**-1, free **IGF**-1 or complexed **IGF**-1, and the disorder is cancer, a diabetic complication exacerbated by **IGF**-1, preferably diabetic retinopathy or diabetic nephropathy, acromegaly, age-related macular degeneration, ischemic injury, or a trauma.

AB Insulin-like growth factor **binding protein** (**IGFBP**)-3, a p53-response gene, can induce apoptosis in an **IGF**-independent manner. Here we demonstrate that **IGFBP-3** mediates p53-induced apoptosis during serum starvation using two foil neoplastic cell models: one which introduces p53 activity and one which eliminates it. We created a doxycycline-inducible p53 model from the p53-neg. PC-3 prostate cancer cell line. Doxycycline treatment increased both p53 and **IGFBP-3** levels. It also augmented apoptosis, but not during insulin-like growth factor-I co-treatment. In a second model, lung carcinoma H460 cells expressing fully functional p53 were stably transfected with E6, which targets p53 for degradation H460-E6 cells contained less p53 and **IGFBP-3** than control neo-transfected cells, and proteasome blockade restored both. In serum deprivation, H460-E6 cells had enhanced growth and less apoptosis than did H460-neo cells. Redns. in H460-neo apoptosis, comparable in magnitude to H460-E6, were achieved by adding anti-**IGFBP-3**-antibody or **IGFBP-3** antisense oligomers, but not non-specific Ig or **IGFBP-3** sense oligomers. In summary, turning p53 'on' in two foil neoplastic cell models induced **IGFBP-3** expression and increased apoptosis during serum starvation, an effect inhibited by insulin-like growth factor-I treatment and specific **IGFBP-3** blockade. This is the first demonstration of inhibition of p53 action by antagonizing **IGFBP-3.**

Section cross-reference(s): 2, **15**
AB OBJECTIVE AND BACKGROUND: The cancer cachexia syndrome is characterized by anorexia, weight loss with muscle wasting and increased energy expenditure. It is associated with increased morbidity and mortality, but its etiol. is poorly understood and no effective therapeutic intervention is available. It may result from an imbalance between the activity or effect of anabolic and catabolic hormones, mediated by the inflammatory cytokines. **IGF**-I is a potent anabolic agent, with therapeutic potential. Our objective was to investigate the role and regulation of the **IGF** system in cancer cachexia. DESIGN AND PATIENTS: We set up a prospective study of 30 patients with newly diagnosed unresectable non-small cell lung cancer, together with a cross-sectional comparison group of healthy

volunteers. MEASUREMENTS: We examined the relationship between aspects of the **IGF** system, including **IGFBP-3** proteolysis (using Western ligand and immunoblotting and an in vitro **IGFBP-3** protease assay); the inflammatory cytokines and their soluble receptors; and food intake and nutritional status (including biochem. and anthropometric assessments). RESULTS: Although we did not observe a marked reduction in food intake in the cancer patients, the majority lost weight and functionally important lean body mass. We observed GH resistance in the cancer patients, and intermittent proteolysis of **IGFBP-3**, which correlated with the circulating interleukin-6 (IL-6) concentration The pattern of **IGFBP-3** proteolysis was unusual, with a prominent 17-kDa fragment. Less **IGFBP-3** proteolysis was associated with more weight loss, suggesting that this could be a protective counter-regulatory mechanism, increasing **IGF**-I bioavailability to the tissues. CONCLUSIONS: Cancer cachexia in humans is a complex condition. Patients tend to be GH resistant. The significance of the intermittent increases in **IGFBP-3** proteolysis, which may be regulated by IL-6, remains uncertain. A better understanding of the pathophysiol. should enable the development of novel therapeutic approaches.

AB Insulin-like growth factors (**IGFs**) have mitogenic and antiapoptotic properties and have been implicated in the development of lung cancer. The effects of **IGFs** are modulated by **IGFBPs**. This study explored the effects of **IGFBP**-3 on non-small cell lung cancer (NSCLC) cells after infection with an adenovirus constitutively expressing **IGFBP-3** under the control of the cytomegalovirus promoter (Ad5CMV-BP3). The authors found that **IGFs**, especially **IGF**-I, stimulated the growth of NSCLC cells, and Ad5CMV-BP3 suppressed this **IGF**-I-induced NSCLC cell growth. They also found that the clonogenicity of H1299 cells in soft agar was markedly reduced by Ad5CMV-BP3. Furthermore, direct injection of Ad5CMV-BP3 into H1299 NSCLC xenografts s.c. established in athymic nude mice induced massive destruction of the tumors. Ad5CMV-BP3 did not induce detectable cytotoxicity on normal human bronchial epithelial cells, suggesting therapeutic efficacy of this virus. Ad5CMV-BP3 infection was accompanied by apoptotic cell death in vitro as detected by flow cytometry, DNA fragmentation anal., and Western blot anal. on the expression of Bcl-2 and on the cleavage of poly(ADP-ribose) polymerase, a substrate of caspase 3. Immunofluorescence confocal microscopy was also used to show the apoptotic effect of Ad5CMV-BP3 in H1299 tumors established in nude mice. These findings indicated that **IGFBP-3** was a potent inducer of apoptosis in NSCLC cells

in vitro and in vivo. To delineate the underlying mechanism, the authors examined the effect of **IGFBP-3** on Akt/protein kinase B and glycogen synthase kinase-3β, downstream mediators of the phosphatidylinositol 3-kinase pathway, and on mitogen-activated protein kinase (MAPK), all three of which are activated by **IGF**-mediated signaling pathways and have important roles in cell survival. **IGFBP-3** overexpression inhibited the phosphorylation of Akt and glycogen synthase kinase-3β and the activity of MAPK. Furthermore, **IGF**-I rescued the NSCLC cells from serum depletion-induced apoptosis, and this rescue was blocked in Ad5CMV-BP-3-infected H1299 NSCLC cells. Transient transfection with activated Akt or constitutively active MAPK kinase-1, an upstream activator of MAPK, partially blocked **IGFBP-3**-induced apoptosis of NSCLC cells. These findings suggested that the growth-regulatory effect of **IGFBP-3** on NSCLC cells was attributable in part to the inhibition of the **IGF**-induced survival pathway. These data demonstrate the importance of **IGFBP -3** in the regulation of NSCLC cell proliferation, clonogenicity, and tumor growth, suggesting that **IGFBP-3** is a target for the treatment of lung cancer and that Ad5CMV-BP3 is a potential therapeutic agent.

CLASS

PATENT NO.	CLASS	PATENT FAMILY CLASSIFICATION CODES
WO 2001087238	ICM	A61K

AB There is disclosed an isolated cDNA sequence (SEQ ID NO:1), clone 4.33, encoding a polypeptide and comprising a coding region (SEQ ID NO:2) of the sequence described in SEQ ID NO:1, or a sequence having at least 90% homol. with the coding region of SEQ ID NO:1. The clone 4.33 polypeptide functions as a specific cell-surface receptor for **IGF**-BP-3 (**insulin-like growth factor binding protein** 3), and undergoes nuclear translocation in combination with **IGF**-BP-3. **IGF**-BP-3 and **IGF**-BP-3R (**insulin-like growth factor binding protein 3** receptor P4.33) cooperatively suppress DNA synthesis and cell growth, and induce caspase activation and apoptosis in cancer cells, indicating that clone 4.33 is an important mediator of **IGF**-independent growth inhibitory actions of **IGF**-BP-3. The P4.33:**IGFBP-3** system of the present invention can be used, inter alia, in screening and diagnostic assays, and for therapeutic methods for cancer treatment and tumor suppression. CDNA clone 4.33 is expressed in multiple human tissues and is differentially expressed in normal vs. cancerous human cell lines. There is a significant decrease in endogenous expression of clone 4.33 in PC-3 prostate cancer cells. Exptl. results from overexpression of **IGF**-BP-3R in cancer cell lines suggest that it represents a novel mammalian cell death receptor.

AB Mol. pathol. of lung cancer (LC) investigates mol.-genetic rearrangements initiating development and growth of the tumor. The system of insulin-like growth factors (**IGF**) and **binding proteins** (**IGFBP**) regulates cell proliferation in the majority of embryonal and tumor tissues of man and animals in the course of reparation processes and productive inflammatory reaction. A general property of all LC histol. types is the presence in their cells of various members of **IGF**-system. Content of IGFII in tumor cells correlated with **IGFBP**-1, **IGFBP**-2, **IGFBP**-5. Localization of IGFII and **IGFBP** in LC was different. **IGFBP**-1, -2, and -5, blocking IGFII, are detected in large amts. in areas of cell death inducing apoptosis while IGFII accumulates in dividing cells and foci of keratinization. Nuclear deposits of **IGFBP-3** in bronchioloalveolar LC create phenomenon of intranuclear inclusion of "owl's eye" type. Synthesis of the majority of **IGF** occurs in tumor cells. Stromal cells also produce and transport of IGFII and **IGFBP** into the tumor.

AB A review with ~ 316 refs. The insulin-like growth factors (**IGFs**) are mitogens that play a pivotal role in regulating cell proliferation, differentiation, and apoptosis. The effects of **IGFs** are mediated through the **IGF**-I receptor, which is also involved in cell transformation induced by tumor virus proteins and oncogene products. Six **IGF-binding proteins** (**IGFBPs**) can inhibit or enhance the actions of **IGFs**. These opposing effects are determined by the structures of the **binding proteins**. The effects of **IGFBPs** on **IGFs** are regulated in part by **IGFBP** proteases. Laboratory studies have shown that **IGFs** exert strong mitogenic and antiapoptotic actions on various cancer cells. **IGFs** also act synergistically with other mitogenic growth factors and steroids and antagonize the effect of antiproliferative mols. on cancer growth. The role of **IGFs** in cancer is supported by epidemiol. studies, which have found that high levels of circulating **IGF**-I and low levels of **IGFBP-3** are associated with increased risk of several common cancers, including those of the prostate, breast, colorectum, and lung. Evidence further suggests that certain lifestyles, such as one involving a high-energy diet, may increase **IGF**-I levels, a finding that is supported by animal expts. indicating that **IGFs** may abolish the inhibitory effect of energy restriction on cancer growth. Further investigation of the role of **IGFs** in linking high energy intake, increased cell proliferation, suppression of apoptosis, and increased cancer risk may provide new insights into the etiol. of cancer and lead to new strategies for cancer prevention.

AB **IGF**-I and **IGF**-II are potent mitogens, postulated to exert autocrine/paracrine effects on growth regulation in human lung cancer. Their proliferative effects are modulated by **IGF-binding proteins** (**IGFBPs**), which are found in conditioned medium (CM) of lung cancer cell lines. The biol. role of the **IGFBPs**, which are ontogenetically and hormonally regulated, is not fully understood. Both inhibitory and stimulatory effects on cell growth have been demonstrated. Exogenous **IGFBP-3** has been consistently shown to block **IGF** action, inhibiting cell growth in vitro. In order to evaluate the action of endogenously produced **IGFBP-3** on cell growth in lung cancer, we stably transfected the non-small cell lung cancer cell line NCI-H23 with human **IGFBP-3** cDNA (resulting in NCI-H23 pOPI3/BP-3) or with the vector pOPI3CAT as control (resulting in NCI-H23 pOPI3CAT). RT-PCR confirmed expression of **IGFBP-3**-specific mRNA in NCI-H23 pOPI3/BP-3, but not in NCI-H23 or NCI-H23 pOPI3CAT. Western ligand blot and Western immunoblot anal. of CMs yielded strong signals of the characteristic 40-44 kDa human **IGFBP-3** protein in NCI-H23 pOPI3/BP-3. An **IGFBP-3** ELISA demonstrated a 20-fold increase in **IGFBP-3** protein expression in NCI-H23 pOPI3/BP-3 as compared with NCI-H23. The growth of NCI-H23 pOPI3/BP-3 in serum-containing medium was significantly slower (1.7-fold) than that of NCI-H23 or the vector-transfected control NCI-H23 pOPI3CAT. While the proliferation rate of parental and vector-transfected cells could be stimulated by **IGF**-I, **IGF**-II, **IGF**-I analog Long R3 **IGF**-I or insulin, that of NCI-H23 pOPI3/BP-3 could not. Xenotransplantation in nude mice resulted in a marked tumor growth after the injection of NCI-H23 or NCI-H23 pOPI3CAT, but absent or minimal growth for the **IGFBP-3**-transfected cell line. These data suggest that **IGFBP-3** is a potent inhibitor of cell growth in human lung cancer cell lines and may impair tumorigenicity in vivo.

AB Background: We hypothesize that accumulation of genetic damage is dependent on an individual's intrinsic carcinogen sensitivity and on various humoral factors (e.g., insulin-like growth factors [**IGFs**]) that enhance proliferation, resistance to apoptotic cell death, and clonal outgrowth of genetically damaged cells. We tested this hypothesis by determining whether proliferation potential and genetic instability are associated with the risk of lung cancer. Methods: In a study of 183 lung cancer patients and 227 matched control subjects, we examined the joint effects of latent genetic instability (measured as mutagen sensitivity) and elevated proliferation potential (assessed by measuring **IGFs**) in lung cancer risk. Levels of **IGF**-I, **IGF**-II, and **IGF-binding protein**-3 (**IGFBP**-3) in plasma were measured by use of immunoassay kits. Mutagen sensitivity was assessed by quantitating bleomycin- and benzo[a]pyrene diol epoxide (BPDE)-induced chromatid breaks in peripheral blood lymphocyte cultures. Results: Although not statistically significant, the mean levels of **IGF**-I and the molar ratio of **IGF**-I/**IGFBP**-3 were higher in patients with advanced or poorly differentiated disease than in patients with early or well-differentiated disease. Variation in **IGFs** was not associated with any specific histol. type or tumor stage. High levels of **IGF**-I and enhanced mutagen sensitivity were individually associated with increased risk of lung cancer: odds ratio (OR) of 2.13 (95% confidence interval [CI] = 1.20-3.78) for **IGF**-I, 2.50 (95% CI = 1.49-4.20) for bleomycin sensitivity, and 2.95 (95% CI = 1.72-5.06) for BPDE sensitivity. The OR was statistically significantly elevated to 8.88 for both higher **IGF**-I and bleomycin sensitivity (95% CI = 3.67-21.50) and to 13.53 for higher **IGF**-I and BPDE sensitivity combined (95% CI = 4.48-40.89). With all three risk factors considered together, the OR was 17.09 (95% CI = 4.16-70.27). High levels of **IGFBP**-3 alone were associated with reduced lung cancer risk: OR = 0.59 (95% CI = 0.33-1.05). Conclusions: Our data suggest that individuals with genetic instability and higher proliferation potential are at enhanced risk for lung cancer.

AB A review with 91 refs. is given. Perturbations of the insulin-like growth factor (**IGF**) axis, including the autocrine production of **IGFs**, **IGF binding proteins** (**IGFBPs**) and **IGFBP** proteases such as prostate specific antigen (PSA), and cathepsin D were identified in prostate, lung, and breast cancer cells and tissues. Blood serum **IGFBP-3** levels were found to be neg. correlated to the risk of cancer. Interestingly, **IGFBP-3** is a potent inhibitor of **IGF** action and also mediates apoptosis via an **IGF** -independent mechanism. Recent case-control studies have found an approx. 10% increase in the serum levels of **IGF**-I in patients with prostate, breast, and lung cancers, which are among the most frequently diagnosed cancers. While the studies indicate an association between serum **IGF**-I levels and cancer risk, causality was not established. Thus, serum **IGF**-I level may actually be a confounding variable, serving as a marker for autocrine tissue **IGF**-I production Growth hormone (GH) therapy raises both **IGF**-1 and **IGFBP**-3 levels in serum. However, the role of GH in controlling prostate, breast, and lung growth and carcinogenesis remains unclear from animal studies. Increased GH levels as seen in acromegaly were associated with benign prostatic hyperplasia but not with prostate, breast, or lung cancers, although colon cancer mortality may be increased. Should serum **IGF**-I levels be proven to play a causal role in the pathogenesis of cancer, interpreting the risk associated with therapies such as GH replacement must take into account both the duration of exposure and the risk magnitude associated with the degree of serum **IGF**-I elevation. Since GH-deficient patients often have a subnormal **IGF**-I serum level, which normalizes on therapy, their cancer risk on GH therapy probably does not increase substantially above that of the normal population. Until further research in the area dictates otherwise, ongoing surveillance and routine monitoring of **IGF**-I levels in GH recipients should become standard of care.

AB Considerable evidence exists that lung cancer cell lines produce large amts. of insulin-like growth factor-**binding proteins** (**IGFBPs**). In addition, these cells are subject to an autocrine or

paracrine growth control by insulin-like growth factors (**IGFs**). The authors now demonstrate by immunocytochem. with **IGFBP-3** antibodies that nuclei of a lung cancer cell line (A549) distinctly immunostain for **IGFBP-3**. This finding led the authors to investigate in more detail the localization of this protein that, to date, had only been known to occur extracellularly. Ligand blotting revealed that purified nuclear exts. contain a 43,000-Da **IGFBP** which can bind [I125]**IGF**-I. By Western blot this protein was identified as **IGFBP-3**. Thus, the authors' data are consistent with the results of a previous structural study predicting a nuclear localization for **IGFBP-3**. Moreover, the authors' findings raise the possibility that nuclear **IGFBP-3** is functional and involved in the pathogenesis of lung cancer.

AB Insulin-like growth factors (**IGFs**) are potent mitogens for lung cancer cells. This proliferative activity is influenced by their **binding proteins** (**IGFBPs**). We report here on the regulatory effects of **IGF**-I and **IGF**-II on the production and release of **IGFBPs** by nonsmall cell lung cancer cell lines (NSCLC). The nine NSCLC cell lines used in this study showed mRNA

expression of all six **IGFBPs** known, as determined by PCR, and protein secretion of **IGFBP**-1, -2, -3, -4, and -6, as analyzed by Western immunoblots. The addition of **IGFs** to a serum-free medium showed divergence effects on **IGFBP**-3 and **IGFBP**-4 levels in a conditioned medium (GM). **IGF**-I and **IGF** -II, but not insulin, led to a much higher concentration of **IGFBP**-3 in the CM of all tested NSCLC cell lines, whereas the level of immunol. detected membrane-associated **IGFBP**-3 was decreased. Furthermore, Northern anal. of mRNA isolated from A549 revealed that **IGFBP**-3 specific mRNA was not changed by **IGF**-I or **IGF**-II, suggesting that the **IGF** -induced effects on **IGFBP**-3 depend on the release of cell-associated **IGFBP**-3. In contrast, **IGFBP**-4 levels were diminished by increasing concns. of **IGFs** in the CM of the NSCLCs A549, NCI-H157, and U1752, with no response to insulin or the **IGF**-I analog, whereas **IGFBP**-4-specific mRNA was not changed by **IGF**-I or **IGF**-II, as determined by Northern anal. The same effects were seen in a cell-free system after incubation of the CM with **IGFs**. The decrease in **IGFBP**-4 concns. was prevented by coincubation of the CM with the **IGFs** and either ethylenediamine tetraacetate or 1,10-phenanthrolene, but not with other protease inhibitors. We suggest that **IGFs** may either activate an **IGFBP**-4-specific metalloprotease present in NSCLC CM or that the binding of **IGFs** to **IGFBP**-4 may enhance the susceptibility of **IGFBP**-4 to proteolytic degradation Based on these data, we present evidence that **IGFs** may regulate their own availability both by releasing **IGFBP**-3 from cell membranes and through proteolytic degradation of **IGFBP**-4.

AB Insulin-like growth factors (IGFs) have mitogenic and antiapoptotic properties and have been implicated in the development of lung cancer. The effects of IGFs are modulated by insulin-like growth factor binding proteins (IGFBPs). This study explored the effects of **IGFBP**-

3 on non-small cell lung cancer (NSCLC) cells after infection with an adenovirus constitutively expressing **IGFBP-3** under the control of the cytomegalovirus promoter (Ad5CMV-BP3). We found that IGFs, especially IGF-I, stimulated the growth of NSCLC cells, and Ad5CMV-BP3 suppressed this IGF-I-induced NSCLC cell growth. We also found that the clonogenicity of H1299 cells in soft agar was markedly reduced by Ad5CMV-BP3. Furthermore, direct injection of Ad5CMV-BP3 into H1299 NSCLC xenografts s.c. established in athymic nude mice induced massive destruction of the tumors. Ad5CMV-BP3 did not induce detectable cytotoxicity on normal human bronchial epithelial cells, suggesting therapeutic efficacy of this virus. Ad5CMV-BP3 infection was accompanied by apoptotic cell death in vitro as detected by flow cytometry, DNA fragmentation analysis, and Western blot analysis on the expression of Bcl-2 and on the cleavage of poly(ADP-ribose) polymerase, a substrate of caspase 3. Immunofluorescence confocal microscopy was also used to show the apoptotic effect of Ad5CMV-BP3 in H1299 tumors established in nude mice. These findings indicated that **IGFBP-3** was a potent inducer of apoptosis in NSCLC cells in vitro and in vivo. To delineate the underlying mechanism, we examined the effect of **IGFBP-3** on Akt/protein kinase B and glycogen synthase kinase-3beta, downstream mediators of the phosphatidylinositol 3-kinase pathway, and on mitogen-activated protein kinase (MAPK), all three of which are activated by IGF-mediated signaling pathways and have important roles in cell survival. **IGFBP-3** overexpression inhibited the phosphorylation of Akt and glycogen synthase kinase-3beta and the activity of MAPK. Furthermore, IGF-I rescued the NSCLC cells from serum depletion-induced apoptosis, and this rescue was blocked in Ad5CMV-BP-3-infected H1299 NSCLC cells. Transient transfection with activated Akt or constitutively active MAPK kinase-1, an upstream activator of MAPK, partially blocked **IGFBP-3**-induced apoptosis of NSCLC cells. These findings suggested that the growth-regulatory effect of **IGFBP-3** on NSCLC cells was attributable in part to the inhibition of the IGF-induced survival pathway. These data demonstrate the importance of **IGFBP-3** in the regulation of NSCLC cell proliferation, clonogenicity, and tumor growth, suggesting that **IGFBP-3** is a target for the treatment of lung cancer and that Ad5CMV-BP3 is a potential therapeutic agent.
